## How to Get List of All Domain User Accounts from Command Line - Windows

Submitted by ingram on Sat, 02/02/2013 - 2:59pm

net user domain list

To get a list of all user accounts in a domain and export them into a text file, run the following command (you need to have the appropriate permissions to run this command, a domain admin will work):

***net user /domain > domain-user-list.txt***

This will export a list of all domain users to a text file in the working directory. This should work in any Microsoft Windows Active Directory Domain.
